

# TEACHING CONVOLUTIONAL NEURAL NETWORKS

Till Korten

With Material from

Johannes Müller, Robert Haase: PoL

Alex Krull, Uwe Schmidt: MPI CBG

Martin Weigert: EPFL Lausanne

Ignacio Arganda-Carreras: Universidad del País Vasco

# WHAT TO EXPECT

- 30 min presentation:
  - Teaching methods
  - Fundamentals of CNNs
- 60 min flipped classroom session
- 30 min break
- 60 min pair programming session
- 30 min feedback and discussion

# CLASSICAL LECTURE

3

- Lecture given by teacher (this presentation)
- Learners prepare exercises on their own
- Teaching assistants grade exercises
- Pro:
  - Familiar for teachers and learners
- Con:
  - One speed for all (too slow for some, too fast for others)
  - Once learners lose track, they remain lost
  - Wasted opportunity of being in a group

# FLIPPED CLASSROOM

4

- Learners individually study materials (before course)
- Exercises solved by group in class
- Materials must be suited for self-study
- Pro:
  - Learners study at their own pace
  - Learner explain exercises to each other: they still remember what was the key information for them to understand
  - Time efficient
- Con:
  - Puts more responsibility on the learners: Learners that do not study will be completely lost

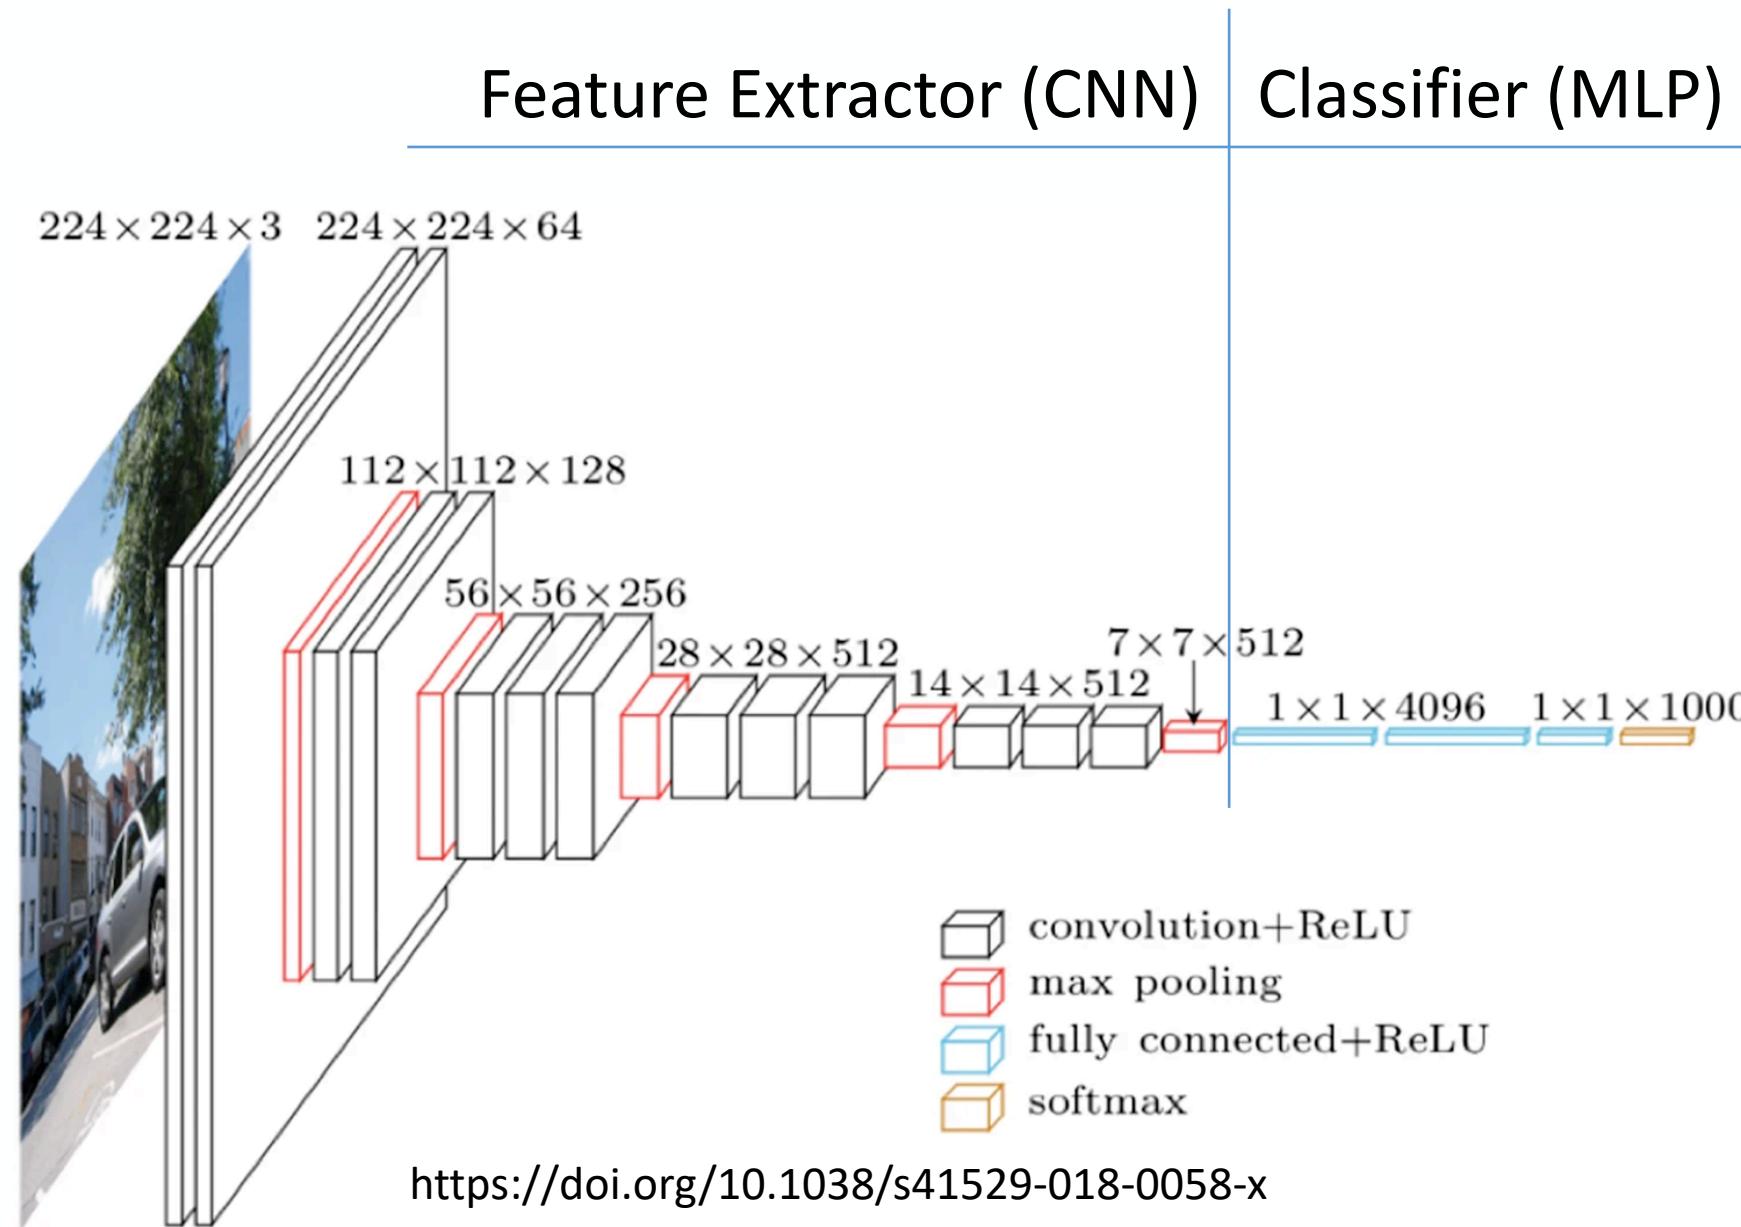

# PAIR PROGRAMMING

5

- Learners study materials and prepare exercises in small groups
- Materials and exercises are discussed in class
- Ideal for audiences with differing experience levels
- Works very well online (breakout rooms)
- For coding:
  - One person writes code (=driver, attention to detail)
  - The others advise and consult (=navigators, high level attention)
  - IMHO hands down the best method for teaching to code
- Pro:
  - Learning is more fun and more efficient in small groups
- Con:
  - Logistics in presence: Noise in large classrooms / Needs a lot of space

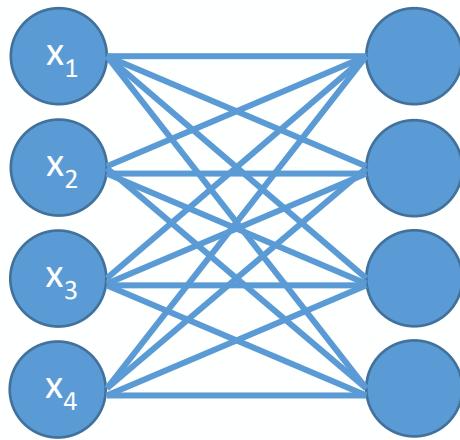

# CNN EXTRACT FEATURES FROM IMAGES

6

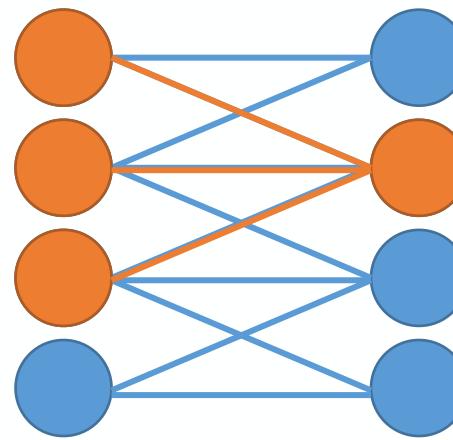

# NETWORK LAYER ARCHITECTURES

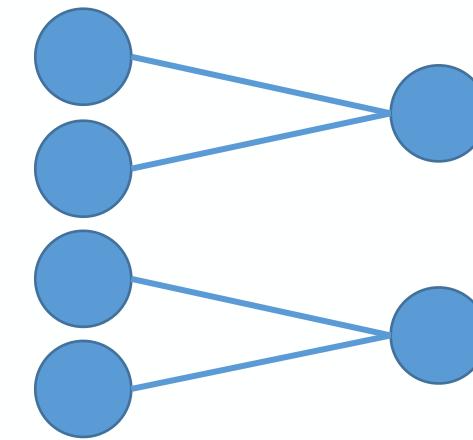

7

Fully connected layer

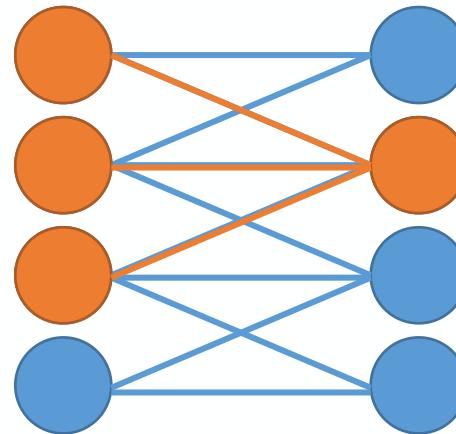

Convolutional layer

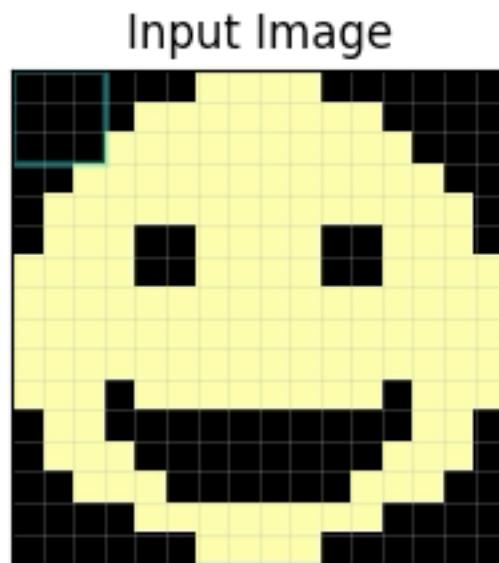

Pooling layer

# CNN - CONVOLUTION WITH LEARNED KERNELS

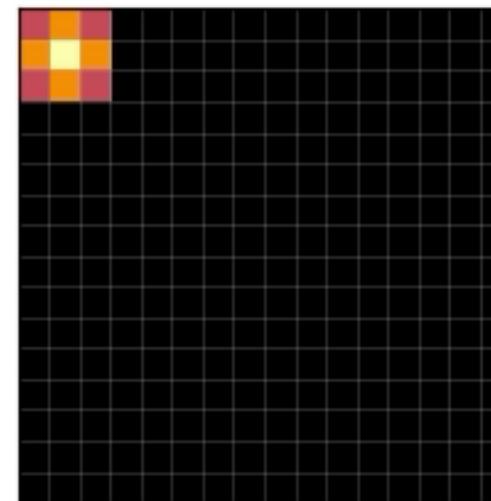

8

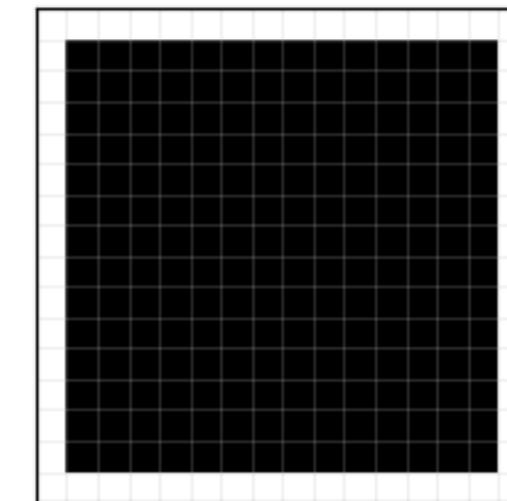

Convolutional layer

Input Image

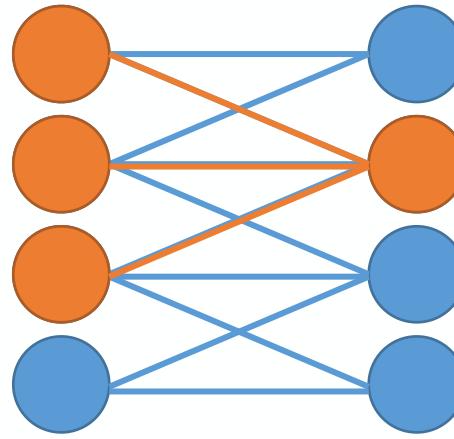

Kernel Position

Convolved Map

# CNN - CONVOLUTION WITH LEARNED KERNELS

9

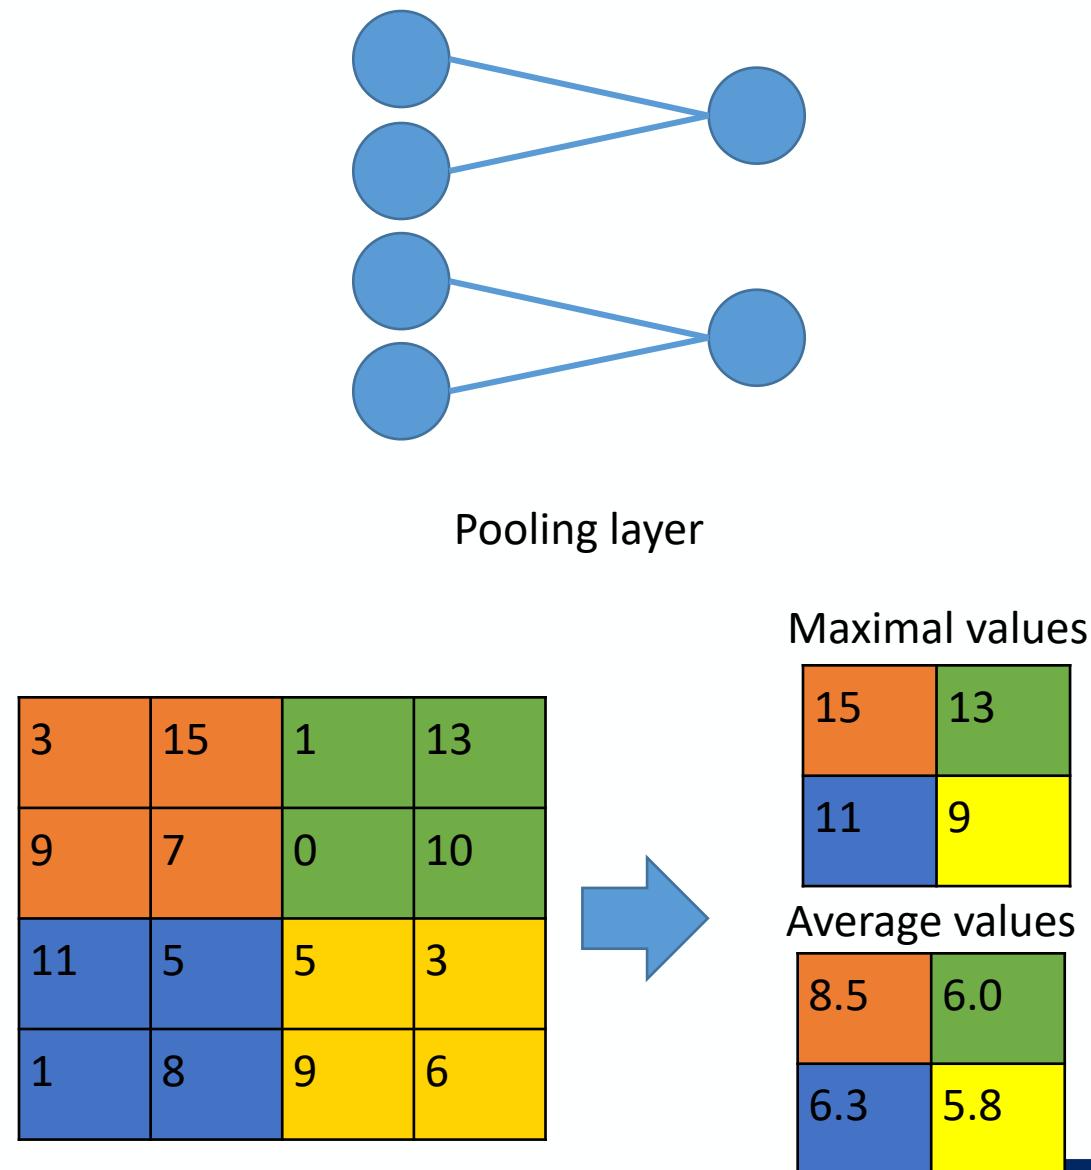

Convolutional layer

- Convolution operation enforces spatial invariance in the network architecture
- Reduces number of parameters
- Makes networks much more computationally and data efficient

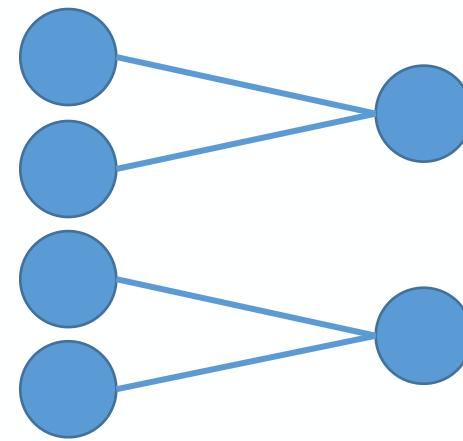

# POOLING LAYERS REDUCE THE LAYER SIZE

10

# POOLING LAYERS REDUCE THE LAYER SIZE

11

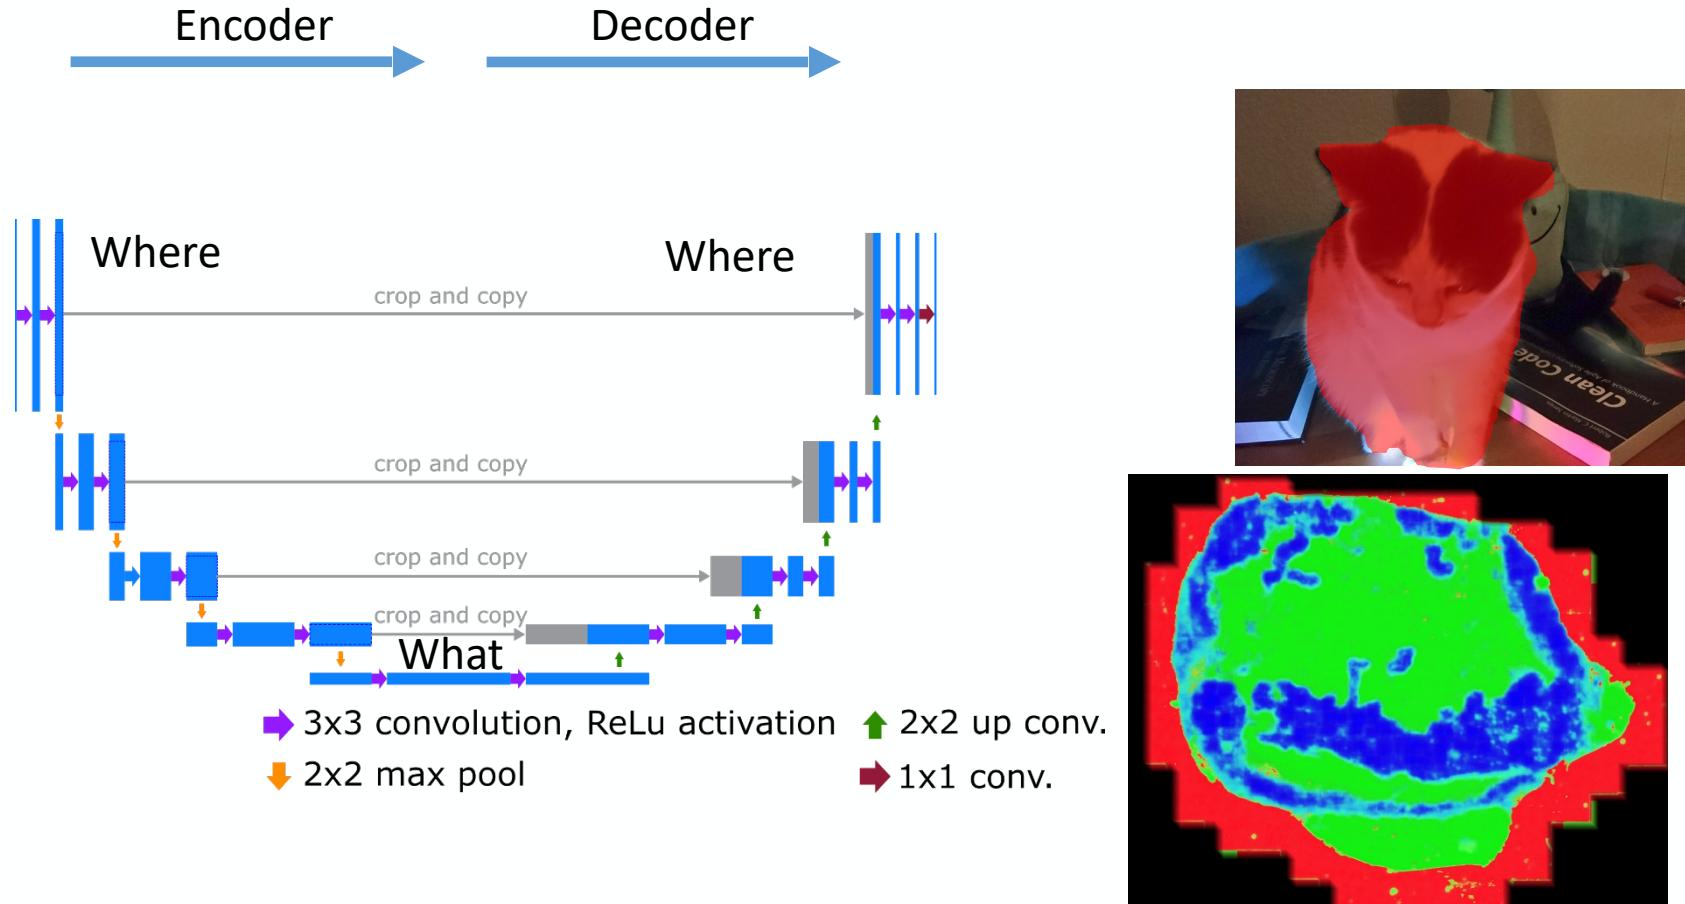

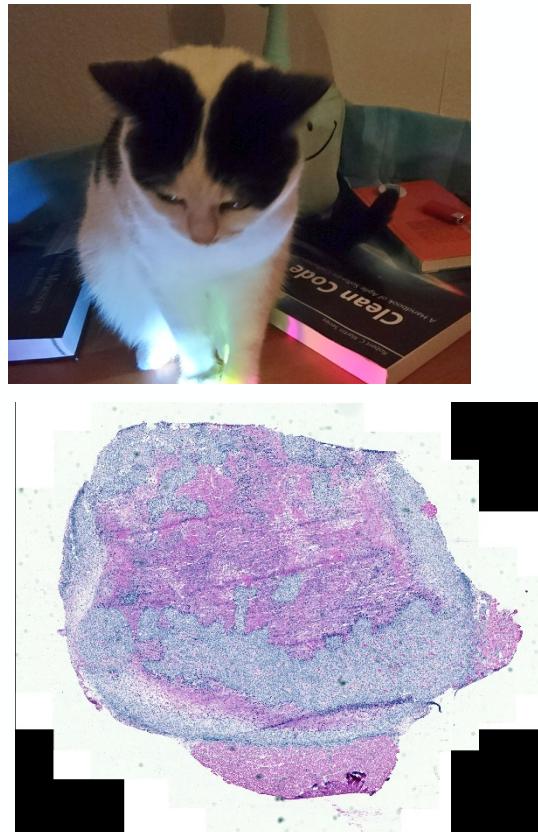

Pooling layer

- Halves input image width/height
- Usually combined with increased size of feature dimension (depth)
- Often followed by batch normalisation to reduce risk of exploding weights
- Helps network to learn more complex features
- Doubles perceptive field

# U-NET: IMAGE SEGMENTATION

12

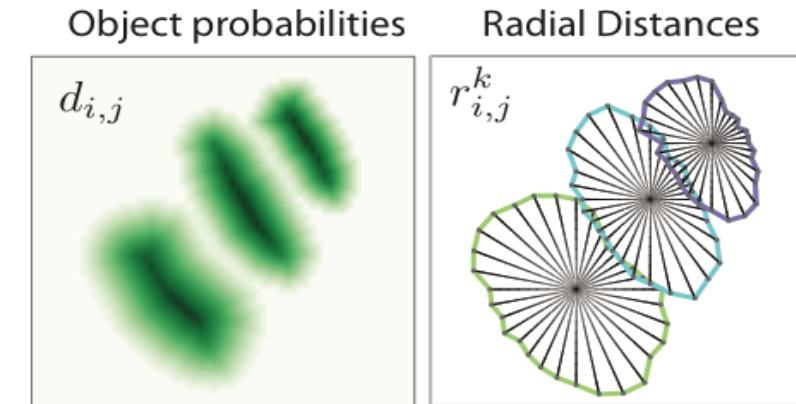

- The U-net is the most used network architecture in biological image processing using CNNs.
  - Encoder: Increase the “What”, decrease the “Where”
  - Decoder: Use the “What”, to identify the “Where”

# STARDIST: NUCLEUS SEGMENTATION

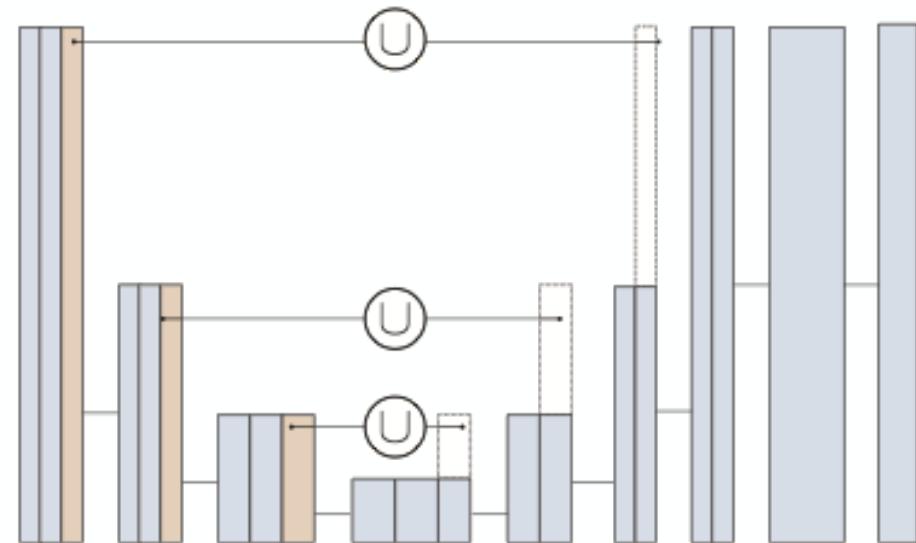

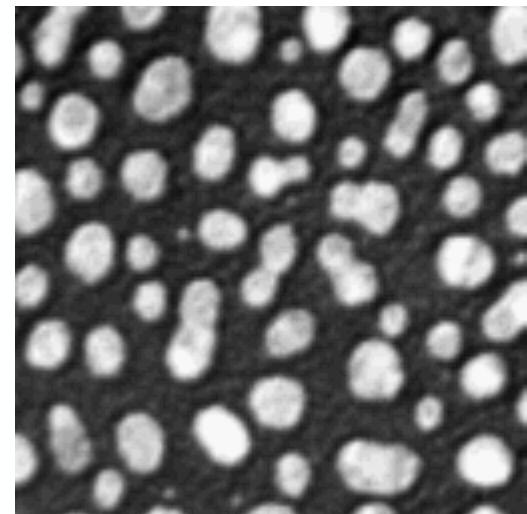

13

## Strategy:

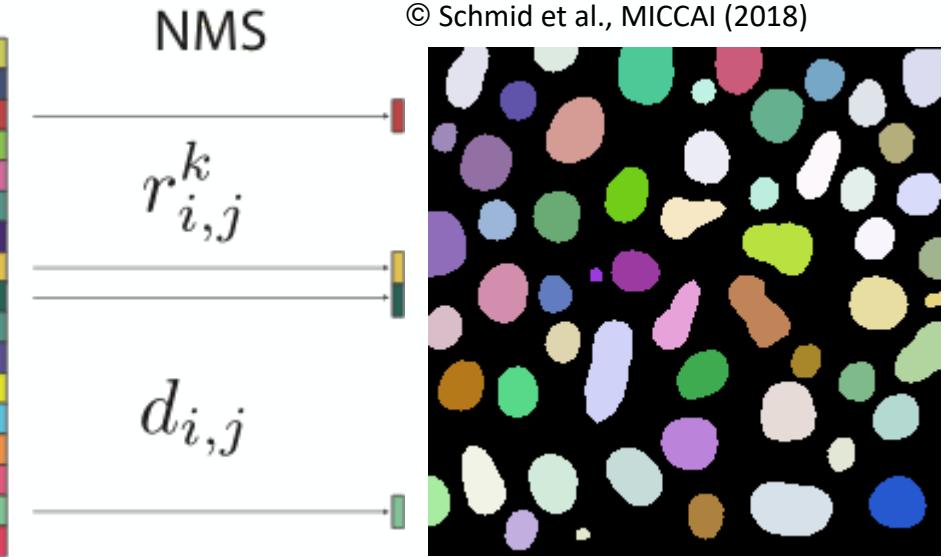

- Add additional information to prediction
- Member pixels of objects (nuclei) can be reached via a straight line from the center

© Schmid et al., MICCAI (2018)

Dense Polygon Prediction  
(e.g. U-Net, ResNet)

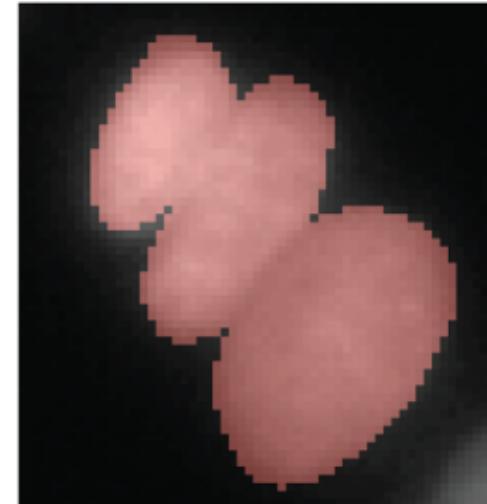

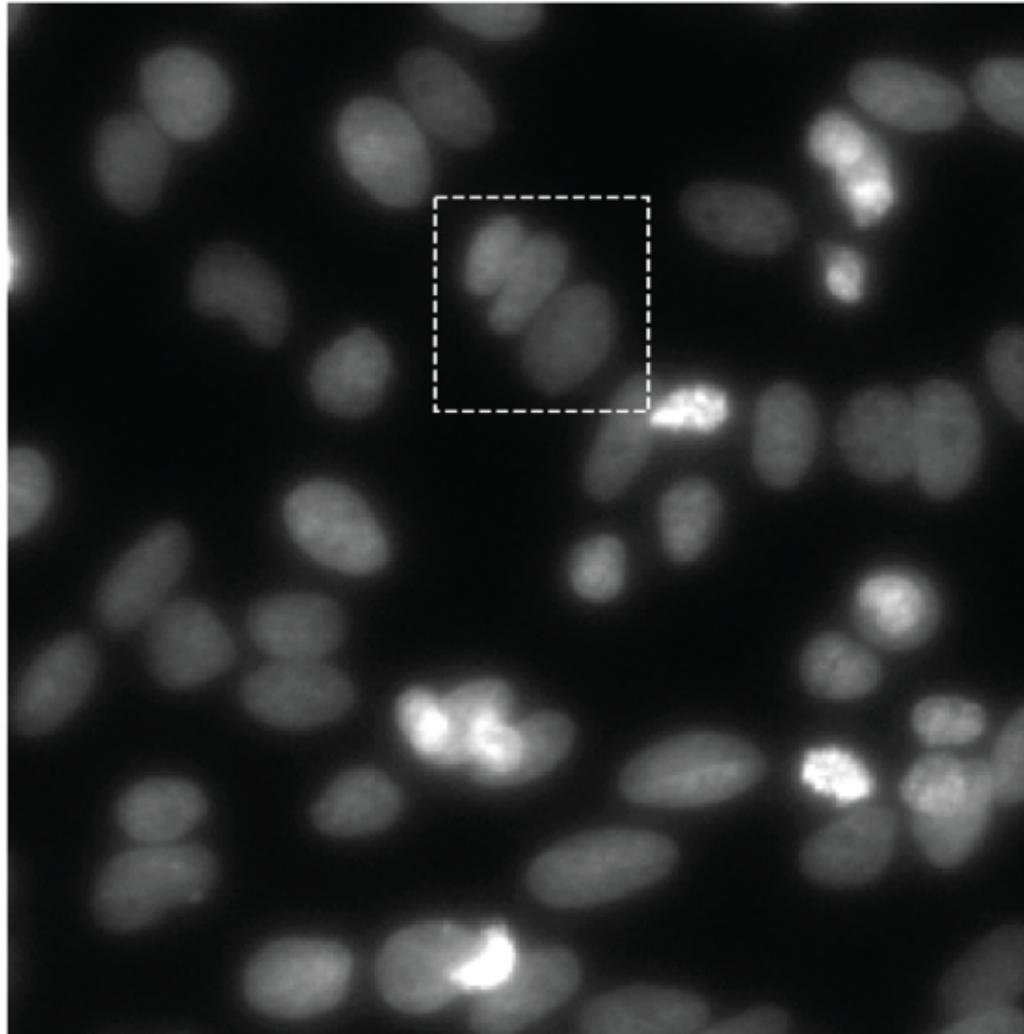

Polygon Selection  
(Non-Maximum Suppression NMS)

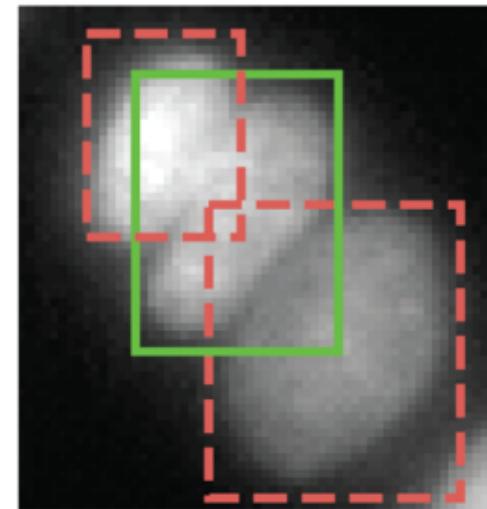

# OTHER ALGORITHMS HAVE PROBLEMS WITH OVERLAPPING NUCLEI

14

Noisy images + Crowded cells = Common source of segmentation errors

Dense Segmentation  
(e.g. U-Net)

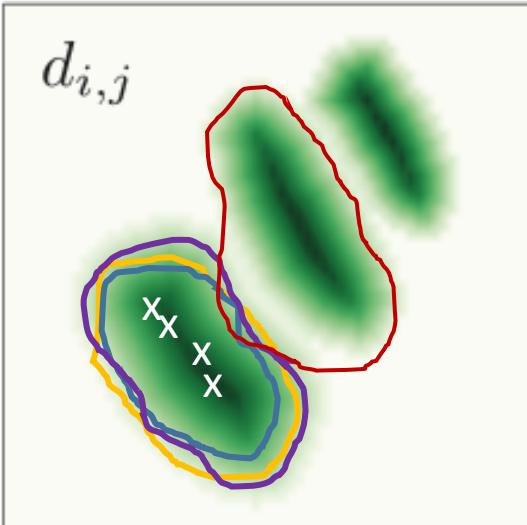

Bounding box based methods  
(e.g. Mask-RCNN)

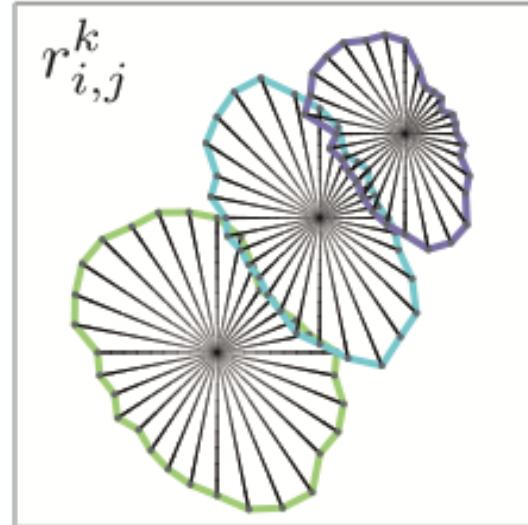

# STARDIST: NON-MAXIMUM-SUPPRESSION RESOLVES OVERLAPS

15

Object probabilities

Radial Distances

© Schmid et al., MICCAI (2018)

## Non-maximum-suppression (NMS):

- Object probabilities: Probability that pixel belongs to class “nucleus”
- Multiple maxima lead to multiple possible polygons for the same nucleus

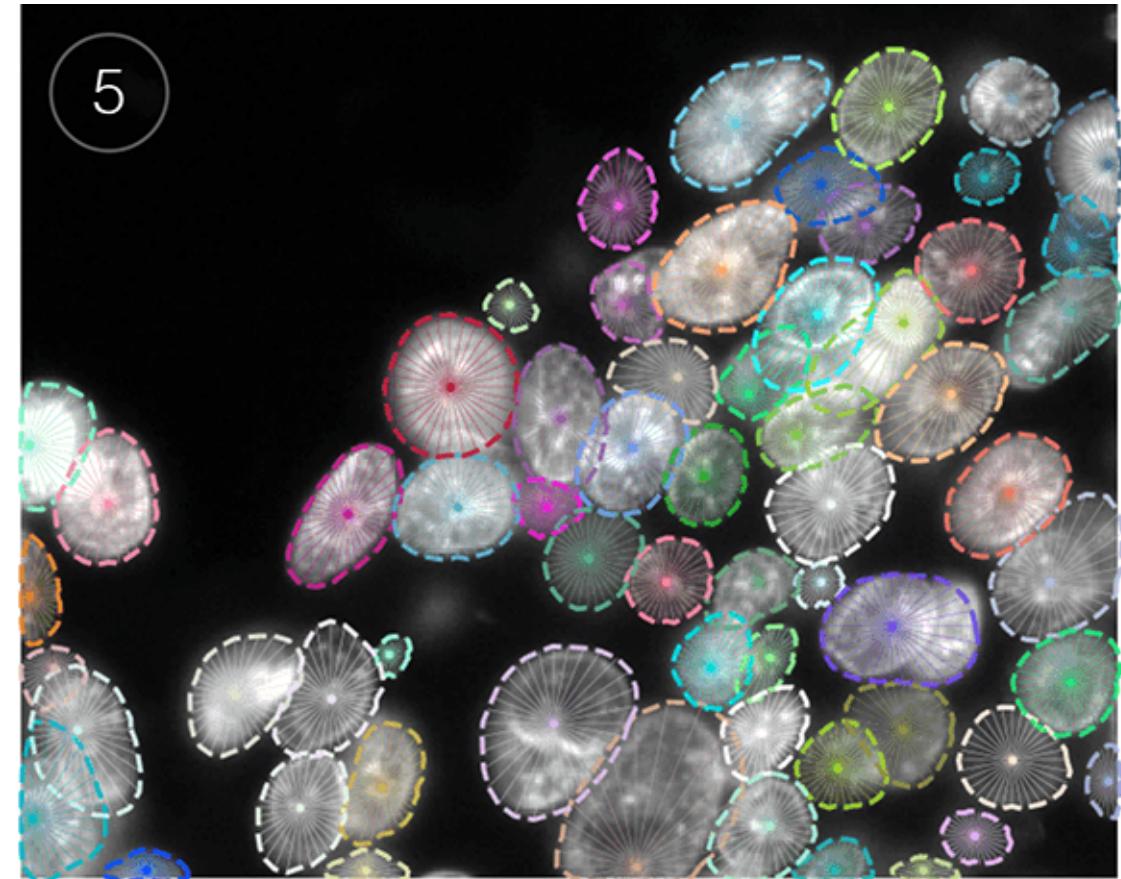

## Algorithm:

- Select polygon with highest object probability inside:
- Look at other polygons: Is the overlap of with larger than threshold  $\tau$ ?
  - Yes: and are actually the same object, drop
  - No: and are separate nuclei
- Setting  $\tau$  very high leads to many false positives!

# STARDIST: NON-MAXIMUM-SUPPRESSION WORKS WELL

16

## Non-maximum suppression

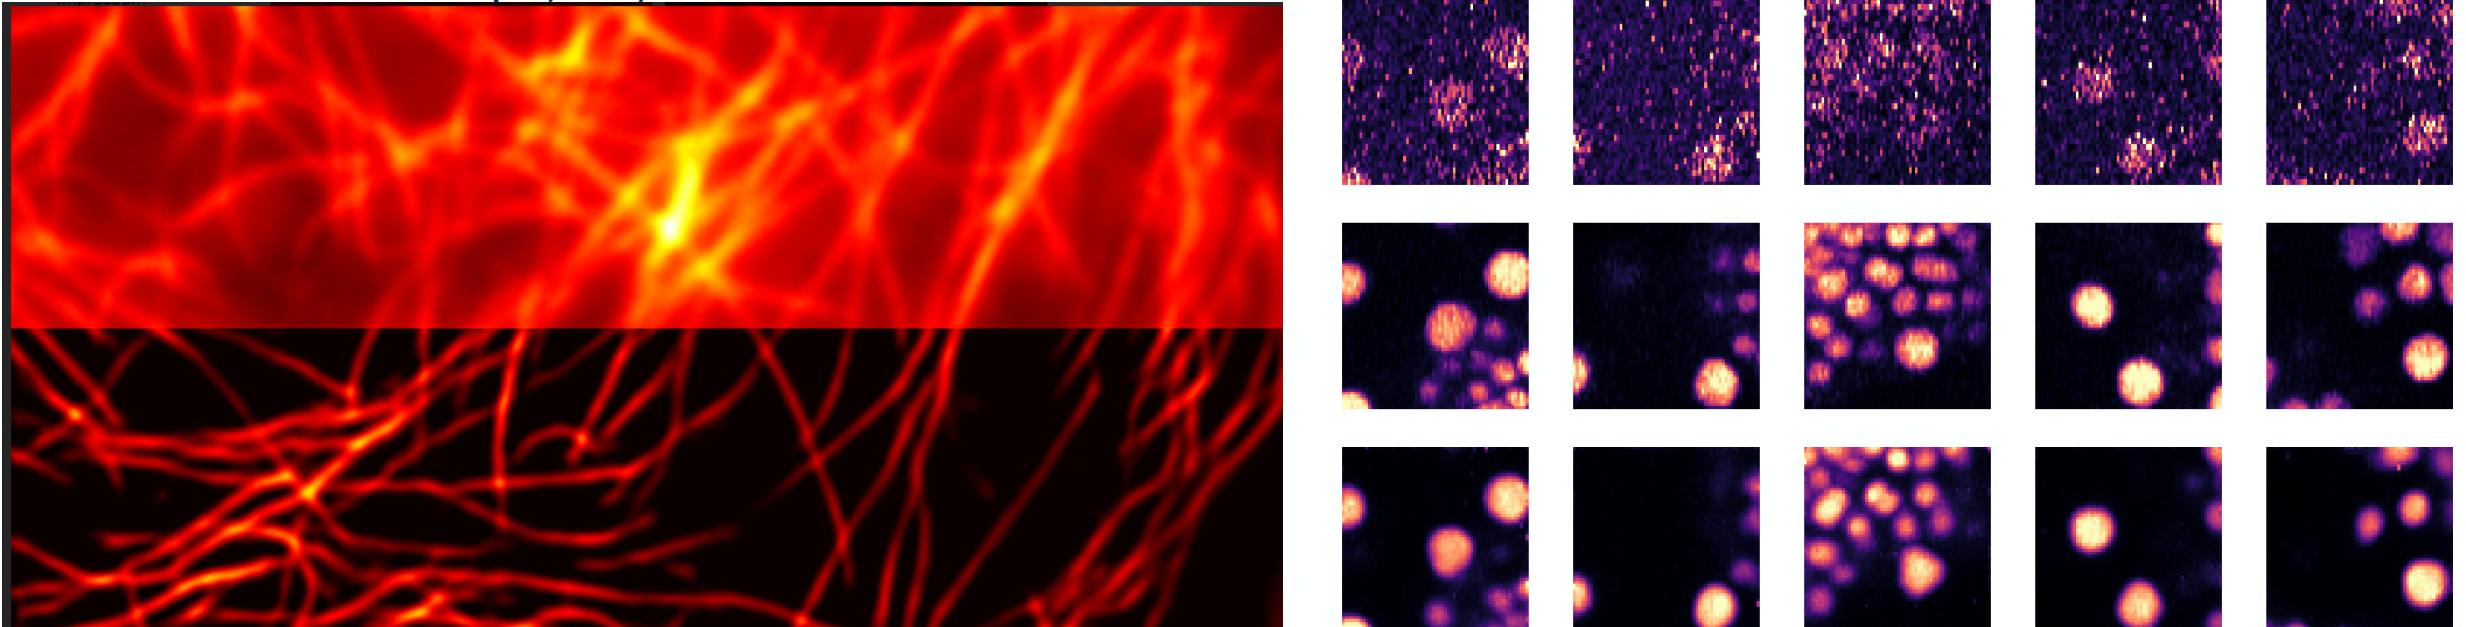

© Schmid et al., MICCAI (2018)

# CARE: IMPROVING RESOLUTION AND DENOISING

17

- CARE: content-aware restoration
- Image acquisition of pairs of images: A high-quality and a low-quality image.
- Caveats:
  - Reconstructs shot noise present in high quality training images
  - Trained model only applicable to image data of the same conditions (biological sample microscope, etc)

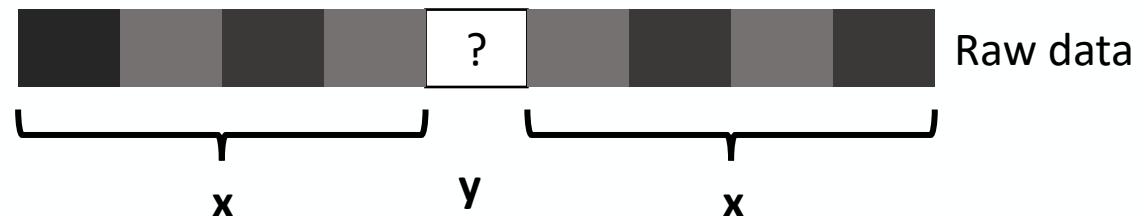

© MPI-CBG, Dresden. All rights reserved.

# NOISE TO VOID: IMAGE DENOISING

18

Raw data = signal + noise

## Strategy:

- Try to predict intensity of pixel  $y$  from surrounding pixels  $x$
- CNN fails to predict noise component → N2V can only reproduce signal from the surroundings of  $y$

## Beware:

- Only **random** noise can be removed, otherwise artifacts occur

<https://github.com/juglab/n2v>

<https://forum.image.sc/t/n2v-artefacts-in-training-data/70686>

HELMHOLTZAI

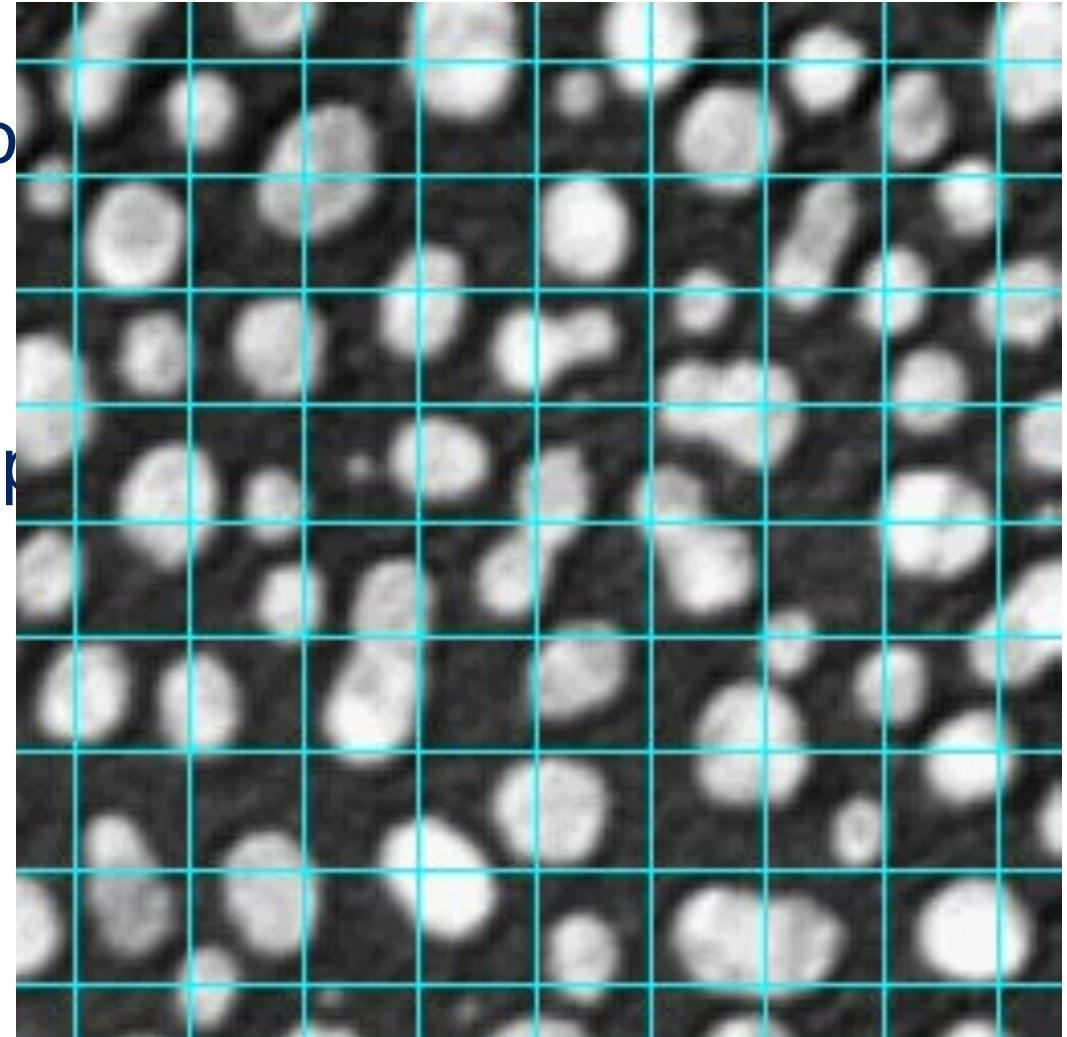

# CAVEATS: GPU MEMORY LIMITS IMAGE SIZE

19

- Images are tiled
- limited “receptive field of the network”

## Receptive field:

- Objects must be smaller than receptive field

## Unbalanced training data:

- Some labels appear more often in training data than others
- Rare events will not be learned because missing them doesn't harm accuracy much
- Weighted data sampling
- Biased results!!

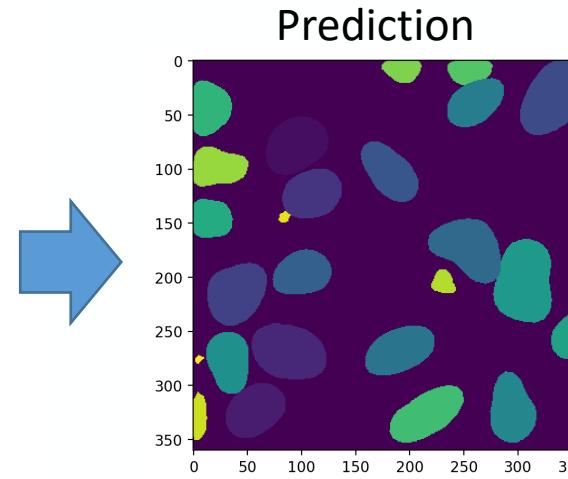

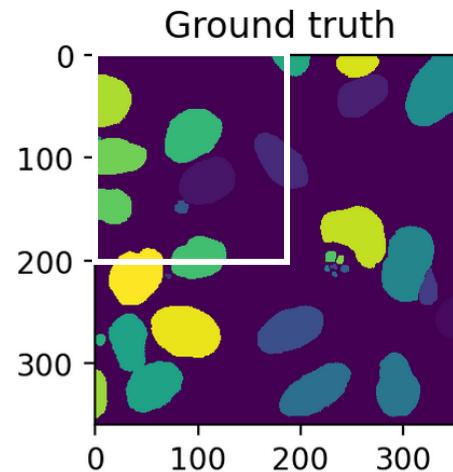

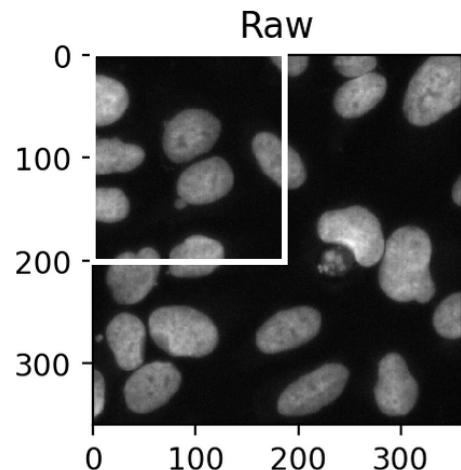

### Is the iPhone racist? Chinese users claim iPhoneX face recognition can't tell them apart

APPLE has come under fire following numerous complaints from Chinese users who claim the iPhone X face recognition can't tell them apart.

<https://www.news.com.au/technology/gadgets/mobile-phones/is-the-iphone-racist-chinese-users-claim-iphonex-face-recognition-cant-tell-them-apart/news-story/13814540e8c82ad466aca687e12af64c>

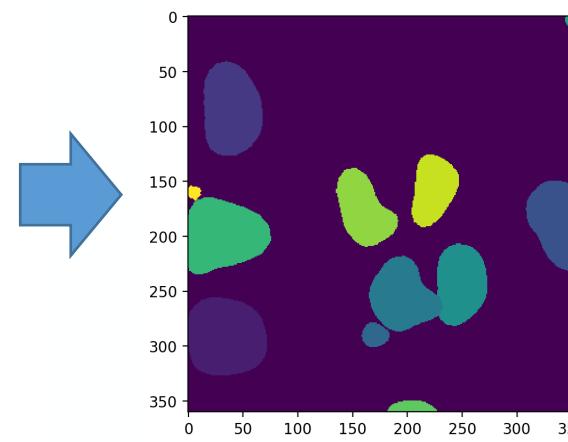

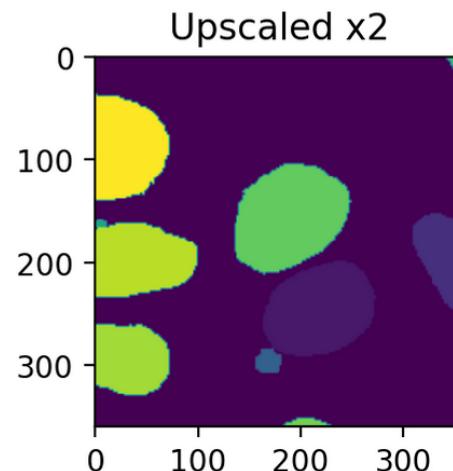

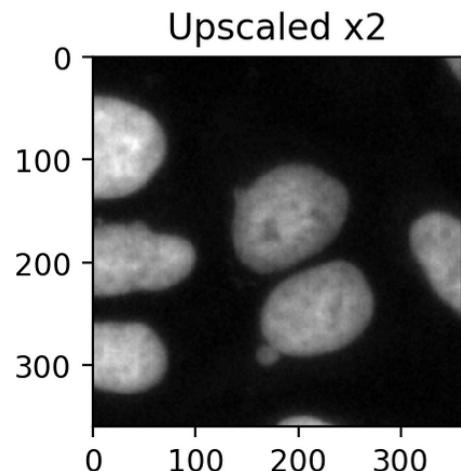

# WHEN THE INPUT DATA DOES NOT FIT TO THE TRAINING DATA

21

What happened here?

Receptive field too small

I used a different resolution than during training

Overfitting

# TAKEAWAYS

22

- With great power comes great responsibility: **Validate your models well!**
- Better data more important than better model
- Often performs fantastic – *but you don't know why*
- Generative neural networks (like CARE) can dream up data – to a hammer everything looks like a nail!

# THANK YOU

23

- For your attention
